XXIII WORLD CONGRESS ON GESTATIONAL TROPHOBLASTIC DISEASE

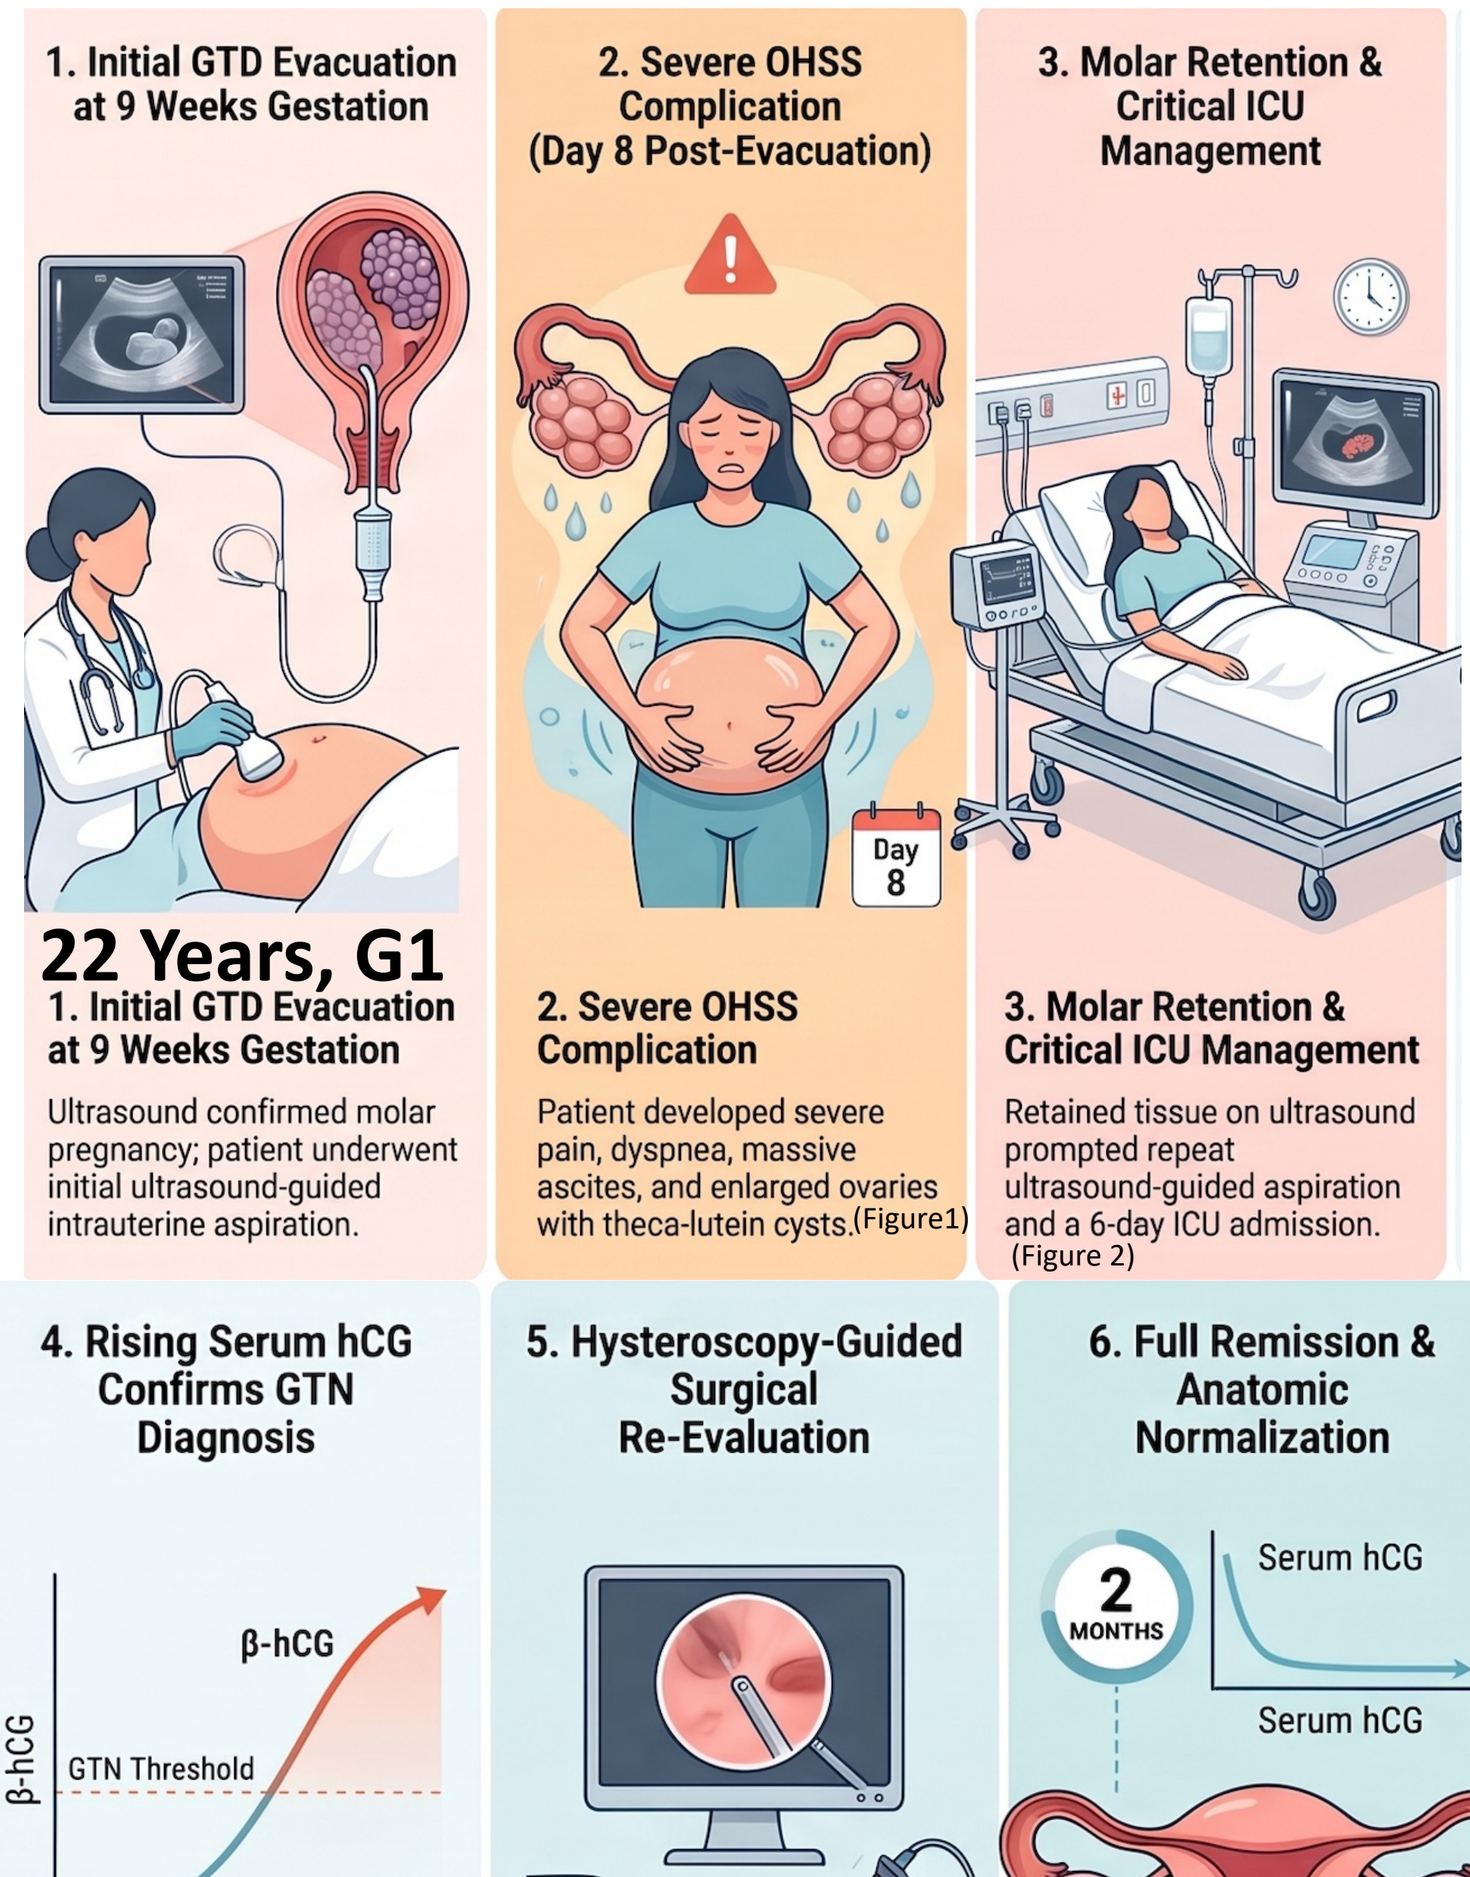

ID 17

Ovarian hyperstimulation syndrome following molar pregnancy: a case report

Daniela Angerame Yela, Laura Sousa Coelho de Sá

University of Campinas - UNICAMP

CASE DESCRIPTION

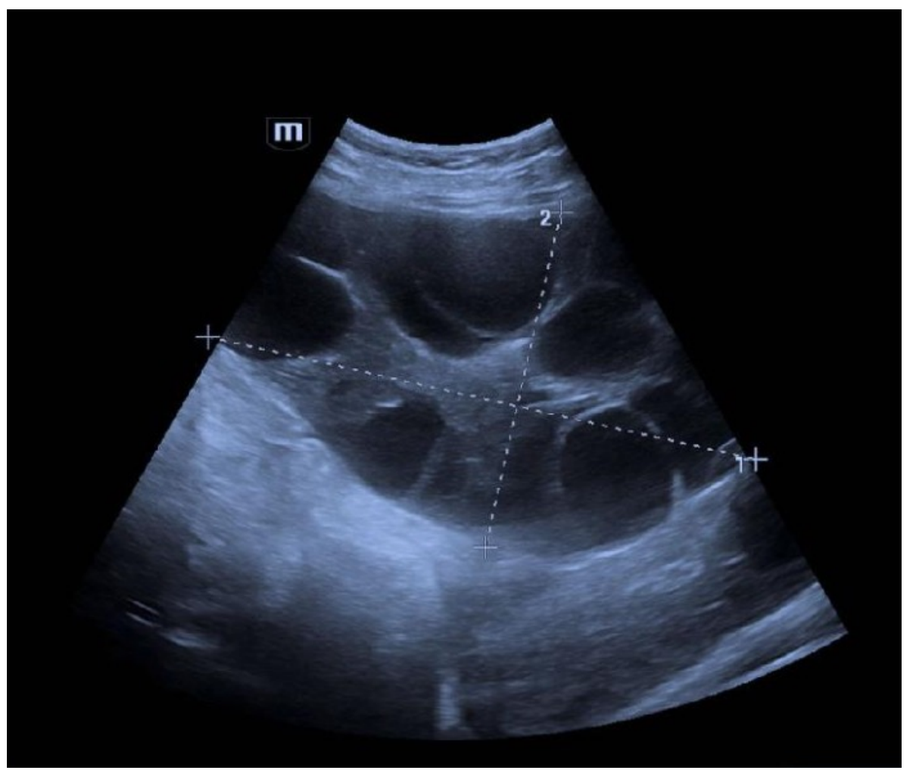

Figure1: Enlarged ovaries with multiple theca-lutein cysts

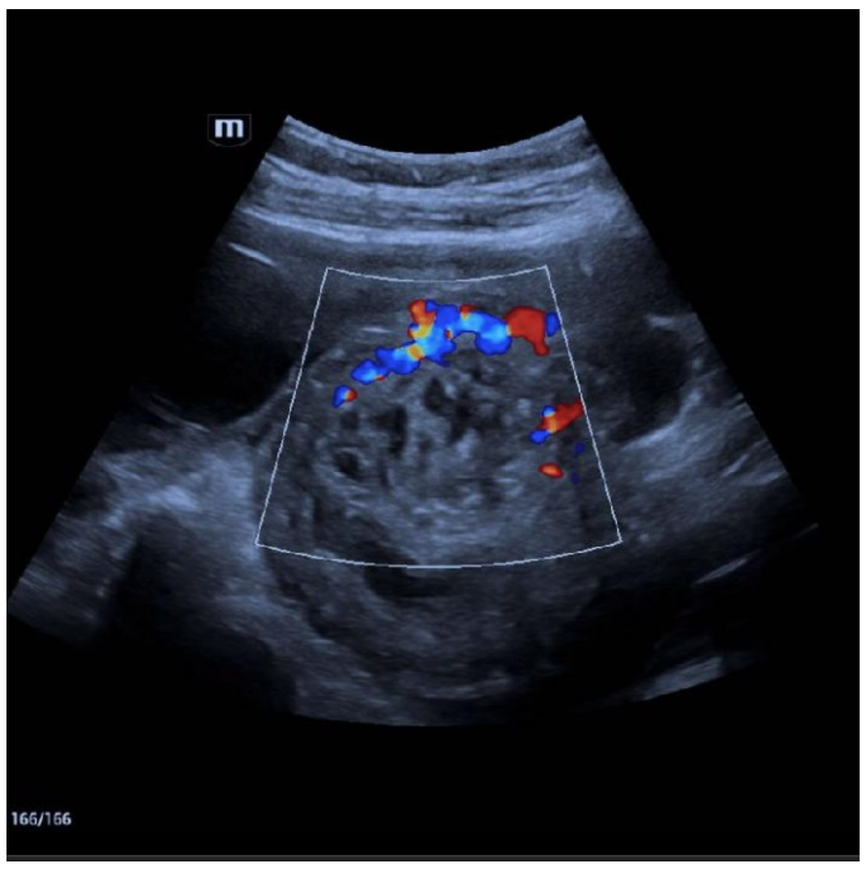

Figure 2: Ultrasound showed retained molar tissue

This case report was approved by the Research Ethics Committee (CAAE:90881125.1.00005404)

CONCLUSION

This case demonstrates an individualized, conservative approach to treating gestational trophoblastic neoplasia. OHSS is a rare complication of gestational trophoblastic disease that can have a favorable clinical outcome when managed at a referral center, and that gestational trophoblastic neoplasia responds to repeat aspiration.
